**Kabourek - Offer of Literature**

Taxonomy and phylogeny Relationships to other insects. Dipterans are endopterygotes, insects that undergo radical metamorphosis. They belong to the Mecoptera, alongside the Mecoptera, Siphonaptera, Lepidoptera and Trichoptera. The possession of a single pair of wings distinguishes most true flies from other insects with "fly" in their names.

**Fly - Wikipedia**

Lepidoptera are morphologically distinguished from other orders principally by the presence of scales on the external parts of the body and appendages, especially the wings. Butterflies and moths vary in size from microlepidoptera only a few millimeters long, to conspicuous animals with a wingspan greater than 25 centimetres, such as the Queen Alexandra's birdwing and Atlas moth.
