Human physiology seeks to understand the mechanisms that work to keep the human body alive and functioning, through scientific enquiry into the nature of mechanical, physical, and biochemical functions of humans, their organs, and the cells of which they are composed. The principal level of focus of physiology is at the level of organs and systems within systems.

Physiology - Wikipedia

61 Exercise 12 Selected Biochemical Reactions Used to Identify the Physiological Characteristics of Bacteria (with special reference to Gram Negative Enteric Rods)

Zoology (/z u ˈiː l ɪ ˈɒləʒi, z oʊ ˈɒləʒi/) or animal biology is the branch of biology that studies the animal kingdom, including the structure, embryology, evolution, classification, habits, and distribution of all animals, both living and extinct, and how they interact with their ecosystems. The term is derived from Ancient Greek ζῷον, zōion, i.e. "animal" and λόγος, logos, i.e. ...

Biopharmaceutical -Omes & -omics glossary taxonomy

752 Nor Faadila et al./IFRJ 20(2): 751-758 that may occur in mass and tissue composition during different molting stages. Expression of results is a critical importance when comparing the changes in

Biochemical and texture property changes during molting

The ER is a complex, dynamic organelle whose functions include protein folding, Ca²⁺ storage, and lipid and carbohydrate metabolism. Diverse cellular stresses, such as perturbations in Ca²⁺ homeostasis, redox imbalance, altered protein glycosylation, or protein folding defects, cause unfolded or misfolded proteins to

accumulate in the ER lumen, a condition known as ERS.

UPR, autophagy, and mitochondria crosstalk underlies the

Nanomedicine, Vol. IIA: Biocompatibility (Landes Bioscience, 2003). The safety, effectiveness, and utility of medical nanorobotic devices will critically depend upon their biocompatibility with human organs, tissues, cells, and biochemical systems.

Free radicals can be defined as molecules or molecular fragments containing one or more unpaired electrons in atomic or molecular orbitals (Halliwell & Gutteridge, 1999). This unpaired electron(s) usually gives a considerable degree of reactivity to the free radical.

Free radicals and antioxidants in normal physiological

Specimen type. Blood is an important biological material that exerts the physiological states of the body functions. Three types of blood specimens: whole blood, plasma and serum can be used and selected according to the needs of the laboratory and the analyte to be studied.

Preanalytical variables and factors that interfere with

However, less is known about the origin of these changes and whether they are a primary cause of aging or are secondary to aging itself. In addition, whether these changes are a consequence of mitochondrial damage or constitute an adaptive mechanism to mitigate age-dependent impairments remains controversial.
