Organic-inorganic sol-gel coating for corrosion protection

Sol-gel chemistry offers a flexible approach to obtaining a diverse range of materials. It allows differing chemistries to be achieved as well as offering the ability to produce a wide range of nano-/micro-structures.

Les procédés sol-gel (ou solution-gélification) permettent la production de matériaux vitreux, éventuellement microporeux à macroporeux par polymérisation (et éventuel retraitement thermique) sans recourir à la fusion.. Le verre est ici directement fabriqué à partir d'une solution liquide (ensuite rendue colloïdale) de silice et d'autres composés chimiques (soude, chaux ...

Amylose is a polysaccharide made of α -D-glucose units, bonded to each other through $(1\rightarrow4)$ glycosidic bonds. It is one of the two components of starch, making up approximately 20-30%. Amylose is more soluble in water than the other component amylopectin. Because of its tightly packed helical structure, amylose is more resistant to digestion than other starch molecules and is therefore an ...

1. Introduction and scope. Many of the best inventions have been made by accident. That was not quite the case for bioactive glass, but it was nonetheless a curious set of events.

Review of bioactive glass: From Hench to hybrids

Application of silica nanoparticles as fillers in the preparation of nanocomposite of polymers has drawn much attention, due to the increased demand for new materials with improved thermal, mechanical, physical, and chemical properties. Recent developments in the synthesis of monodispersed, narrow-size distribution of nanoparticles by sol-gel method provide significant boost to development of ...

Synthesis of Silica Nanoparticles by Sol-Gel: Size

Semi-solid and soft nanoparticles have been manufactured. A prototype nanoparticle of semi-solid nature is the liposome. Various types of liposome nanoparticles are currently used clinically as delivery systems for anticancer drugs and vaccines.

Un gel es un sistema coloidal donde la fase continua es sólida y la dispersa es líquida. Los geles presentan una densidad similar a los líquidos, sin embargo su estructura se asemeja más a la de un sólido. [1] El ejemplo más común de gel es la gelatina comestible.. Ciertos geles presentan la capacidad de pasar de un estado coloidal a otro, es decir, permanecen fluidos cuando son ...
