7.4 MULLER'S METHOD 183 Now, a problem with Eq. (7.27a) is that it yields two roots, corresponding to the  $\pm$  term in the denominator. In Muller's method, the sign is chosen to agree with the sign of  $b$ . This choice will result in the largest denominator, and hence, will give the root estimate that is

There exist closed form solutions to the roots of polynomials for quartics and below, and this is a degree seven polynomial, so thus we must use a numerical technique. We will use  $x_0 = 0$ ,  $x_1 = -0.1$ , and  $x_2 = -0.2$  as our three initial approximations.

Muller's method is a root-finding algorithm, a numerical method for solving equations of the form  $f(x) = 0$ . It was first presented by David E. Muller in 1956. Muller's method is based on the secant method , which constructs at every iteration a line through two points on the graph of  $f$  .

Müller's method is a technique for finding the root of a scalar-valued function  $f(x)$  of a single variable  $x$

when no information about the derivative exists. It is a generalization of the secant method, but instead of using two points, it uses three points and finds an interpolating quadratic polynomial.

### 10.6 Müller's Method | Department of Electrical and
