strength of individual members and of offshore platform subframes weakened by damage due to overload and/or by dents and distortions caused by ship impact or falling objects. In addition to the operational and environmental loads, an offshore platform may be subjected to impact by ships or heavy falling objects.

A new unified procedure for designing tubular members under combined axial load (compression or tension), bending, and hydrostatic pressure on offshore structures, fixed or compliant, is presented.

Offshore platforms are in most of the cases constituted by tubular steel members. In this paper, the response of tubular members to ship bow impacts is analyzed by means of FEM calculations.

A Parametric Study on Efficiency of Tubular Joint Cans in Offshore Structures 24 Fig. 5 gives the relationship between brace outside diameter plotted on the x-axis with allowable out-of-plane bending (OPB) stress along the y-axis. A remarkable decrease in allowable OPB stress takes place with increasing outside brace diameter.

A PARAMETRIC STUDY ON EFFICIENCY OF TUBULAR JOINT CANS IN

Marine growth is accumulated on submerged members. Its main effect is to increase the wave forces on the members by increasing not only exposed areas and volumes, but also the drag coefficient due to higher surface roughness. In addition, it increases the unit mass of the member, resulting in higher gravity loads and in lower member frequencies.

Lecture 15A.12: Connections in Offshore Deck Structures OBJECTIVE/SCOPE To outline and explain the best methods for forming structural connections in offshore deck structures; to discuss the ... tubular members. For a frame type structure, this connection should be rigid and capable of transmitting the yield moment
